A R Rajan Director IMRT Former Professor and Head Departme GENERALIZED INVERSES IN SEMIGROUP OF STOCHASTIC

Introduction

This is an exposition on the paper of Wall (cf. [8]) on generalized inverses of stochastic matrices.

Wall characterises all stochastic matrices admitting a stochastic matrix as its generalised inverse.

He provides a method for computation of these generalised inverses as well.

Also given is a characterization of stochastic matrices admitting stochastic Moore-Penrose inverse.

Generalized Inverses

We begin with familiarization of the terminology and basic concepts.

Generalized inverses are termed as *semi-inverses* in the paper of Wall.

For a matrix \boldsymbol{A} a generalised inverse is a matrix \boldsymbol{X} such that

AXA = A and XAX = X

SQA

The Moore-Penrose inverse of \boldsymbol{A} is a generalized inverse \boldsymbol{X} such that

$$(AX)^* = AX$$
 and $(XA)^* = XA$

where * denotes adjoint.

That is AX and XA are self adjoint projections.

We denote the Moore-Penrose inverse by A^+ .

It is known that every matrix has a Moore-Penrose inverse and it is unique.

Well defined formula for computation of Moore-Penrose inverse using a full rank factorization of the matrix is avilable in literature. For example the book [4].

The following is the procedure given in [4]. Let A be an $n\times n$ matrix of rank k.

Let

$$A = FG$$

be a full rank factorization of A. Then F is an $n \times k$ matrix of rank k and G is $k \times n$ matrix of rank k. Let

$$F^{+} = (F^*F)^{-1}F^*$$

and

$$G^+ = G^* (GG^*)^{-1}.$$

Then the Moore-Penrose inverse A^+ is

$$A^+ = G^+ F^+.$$

In Linear Algebra contexts the matrix A can be any $m\times n$ matrix. In Semigroup Theory we confine to $n\times n$ square matrices so that they form a semigroup.

E > < E >

MQ (P

Stochastic Matrices

An $m \times n$ matrix $A = (a_{ij})$ is said to be a **stochastic** matrix if all its entries are non negative and

$$\sum_{j} a_{ij} = 1$$

for all i.

This may be called row stochastic.

In a similar way column stochastic matrices can also be defined. Combining the two we have **doubly** stochastic matrices also. It may be observed that any doubly stochastic matrix is a square matrix.

Theorem 1

The set SM_n of all stochastic $n \times n$ matrices is a semigroup.

A R Rajan Director IMRT Former Professor and Head Departme GENERALIZED INVERSES IN SEMIGROUP OF STOCHASTIC

▶ < E ▶ < E ▶</p>

nar

Proof.

Let $A = (a_{ij})$ and $B = (b_{ij})$ be stochastic $n \times n$ matrices. Then

$$\sum_{j} a_{ij} = 1 \text{ and } \sum_{j} b_{ij} = 1$$

for all *i*.
Let
$$AB = (c_{ij})$$
 so that

$$c_{ij} = \sum_{k} a_{ik}.$$

A R Rajan Director IMRT Former Professor and Head Departme GENERALIZED INVERSES IN SEMIGROUP OF STOCHASTIC

<日</th>< 日</th>

Then

$$\sum_{j} c_{ij} = \sum_{j} \left(\sum_{k} a_{ik} b_{kj} \right)$$
$$= \sum_{k} a_{ik} \left(\sum_{j} b_{kj} \right)$$
$$= \sum_{k} a_{ik}$$
$$= 1.$$

For doubly stochastic matrices the following is a known theorem.

Theorem 2 (Plemmons and Cline)

Let A be a doubly stochastic matrix. If A has doubly stochastic generalized inverse then it is unique and is A^T . Furter in this case $A^+ = A^T$ where A^+ is the Moore-Penrose inverse of A.

Example 1

The following example shows that a stochastic matrix may not have a stochastic gneralized inverse.

It is doubly stochastic and has no doubly stochastic generalised inverse since A^T is not a generalized inverse of A.

 $A = \begin{pmatrix} \frac{1}{3} & \frac{2}{3} \\ \frac{2}{3} & \frac{1}{3} \end{pmatrix}.$

Here A is invertible and its inverse is

$$A^{-1} = \begin{pmatrix} -1 & 2\\ 2 & -1 \end{pmatrix}.$$

So A has no stochastic generalized inverse also.

A R Rajan Director IMRT Former Professor and Head Departme GENERALIZED INVERSES IN SEMIGROUP OF STOCHASTIC

□ ▶ < □ >

nar

To consider a non invertible case we may modify the above matrix as follows.

$$B = \begin{pmatrix} \frac{1}{3} & \frac{2}{3} & 0 & 0\\ \frac{2}{3} & \frac{1}{3} & 0 & 0\\ 0 & 0 & 1 & 0\\ 0 & 0 & 1 & 0 \end{pmatrix} = \begin{pmatrix} A & 0\\ 0 & C \end{pmatrix}.$$

Now B is a 4×4 matrix of rank 3.

It can be seen that any generalized inverse of B is of the form

$$B' = \begin{pmatrix} X & D \\ E & Y \end{pmatrix}$$

so that X is a generalized inverse of A.

A R Rajan Director IMRT Former Professor and Head Departme GENERALIZED INVERSES IN SEMIGROUP OF STOCHASTIC

医下子 医下

So

$$X = A^{-1} = \begin{pmatrix} -1 & 2\\ 2 & -1 \end{pmatrix}.$$

Thus we see that B' can not be stochastic.

In the article [8], Wall characterizes Stochastic matrices which admit stochastic generalized inverse and gives a method of constructing such generalised inverses.

A R Rajan Director IMRT Former Professor and Head Departme GENERALIZED INVERSES IN SEMIGROUP OF STOCHASTIC

白 ト イヨ ト イヨ ト

SQA

Two main theorems of the above article are the following.

- Characterization of stochastic matrices admitting stochastic generalized inverses.
- Characterization of stochastic matrices for which the Moore-Penrose inverse is stochastic.
- Method of constructing the generalised inverses in case they exist.

同ト・ヨト・ヨト

It may be observed that all stochastic matrices admitting stochastic generalized inverse may not have stochastic Moore-Penrose inverse.

E > < E >

MQ (P

$$A = \begin{pmatrix} \frac{1}{3} & \frac{2}{3} \\ \frac{1}{3} & \frac{2}{3} \end{pmatrix}.$$

It is a stochastic matrix and has stochastic generalised inverse. But its Moore-Penrose inverse is not stochastic.

The following theorem is relevant here.

Theorem 3 (Swarz)

Let E be an idempotent $n \times n$ stochastic matrix of rank k. Then the maximal subgroup H_E in SM_n containing E is isomorphic to the symmetric group S_k . An immediate corollary is the following.

Theorem 4

Let E be an idempotent $n \times n$ stochastic matrix of rank 1. Then the maximal subgroup H_E containing E is the trivial group $\{E\}$.

A R Rajan Director IMRT Former Professor and Head Departme GENERALIZED INVERSES IN SEMIGROUP OF STOCHASTIC

The following theorem appears in [9].

Theorem 5 (Schwarz)

Idempotent rank one stochastic matrices form a right zero semigroup.

It may also be noted that all stochastic rank 1 matrices are idempotents. Also it can be observed that all stochastic rank 1 matrices have repeated rows.

In the case of doubly stochastic matrices (ie. both row stochastic and column stochastic) there is only one rank 1 idempotent $n \times n$ matrix. This is

$$\begin{pmatrix} 1/n & 1/n & \cdots & 1/n \\ 1/n & 1/n & \cdots & 1/n \\ \vdots & \vdots & \vdots \\ 1/n & 1/n & \cdots & 1/n \end{pmatrix}$$

A R Rajan Director IMRT Former Professor and Head Departme GENERALIZED INVERSES IN SEMIGROUP OF STOCHASTIC

Any 2×2 stochastic rank 1 matrix is of the form

$$\begin{pmatrix} \lambda & 1-\lambda \\ \lambda & 1-\lambda \end{pmatrix}$$

for $0 \leq \lambda \leq 1$.
